

C-oxidation BDE Energy Report for: 033_SENECIONINE-out

This report covers the results for bond dissociation enthalpies (BDE) and solvent accessible surface area (SASA) calculations performed for 033_SENECIONINE-out. Oxidation propensity is established using C-H BDE. The lower the C-H BDE values the higher the propensity for C-oxidation. Details for the density functional theory (DFT) calculations and overall workflow are explained at the end of this document.

BDE and SASA

Atom	BDE (kcal/mol)	Propensity
C1	76.45	High
C2	95.64	Low
C5	97.54	Low
C7	90.19	Moderate
C8	75.89	High
C9	113.77	Low
C10	82.92	High
C17	105.17	Low
C20	91.14	Moderate
C22	102.18	Low

Risk Scale:

Calculation Details

Conformational search calculations were performed only for the base ground state molecule. The lowest energy conformer was selected to generate radicals and run optimization DFT calculations. DFT calculations were performed using Gaussian with B3LYP level of theory and 6-31G(d,p) basis set. The BDE protocol was adapted from: *Lienard, P., Gavartin, J., Boccardi, G., & Meunier, M. (2015). Predicting drug substances autoxidation. Pharmaceutical research, 32, 300-310.*
