

C-oxidation BDE Energy Report for: iloperidone

This report covers the results for bond dissociation enthalpies (BDE) and solvent accessible surface area (SASA) calculations performed for iloperidone. Oxidation propensity is established using C-H BDE. The lower the C-H BDE values the higher the propensity for C-oxidation. Details for the density functional theory (DFT) calculations and overall workflow are explained at the end of this document.

BDE and SASA

Atom	BDE (kcal/mol)	Propensity	SASA (Å ²)
C3	112.99	Low	14.17
C4	115.68	Low	32.10
C6	117.79	Low	32.09
C11	85.15	High	11.52
C12	100.0	Low	19.69
C13	90.81	Moderate	15.16
C15	91.34	Moderate	14.88
C16	99.66	Low	19.64
C17	91.02	Moderate	14.41
C18	98.3	Low	18.19
C19	94.49	Low	17.77
C22	111.93	Low	13.35
C23	111.41	Low	18.38

C25	113.89	Low	1.78
C29	97.24	Low	30.15
C31	95.21	Low	29.42

Calculation Details

Conformational search calculations were performed only for the base ground state molecule. The lowest energy conformer was selected to generate radicals and run optimization DFT calculations. DFT calculations were performed using Gaussian with B3LYP level of theory and 6-31G(d,p) basis set. The BDE protocol was adapted from: *Lienard, P., Gavartin, J., Boccardi, G., & Meunier, M. (2015). Predicting drug substances autoxidation. Pharmaceutical research, 32, 300-310.*
